Severity: critical
Resolved: 2026-09-08
Affected systems: checkout-service, payments-api, edge-gateway

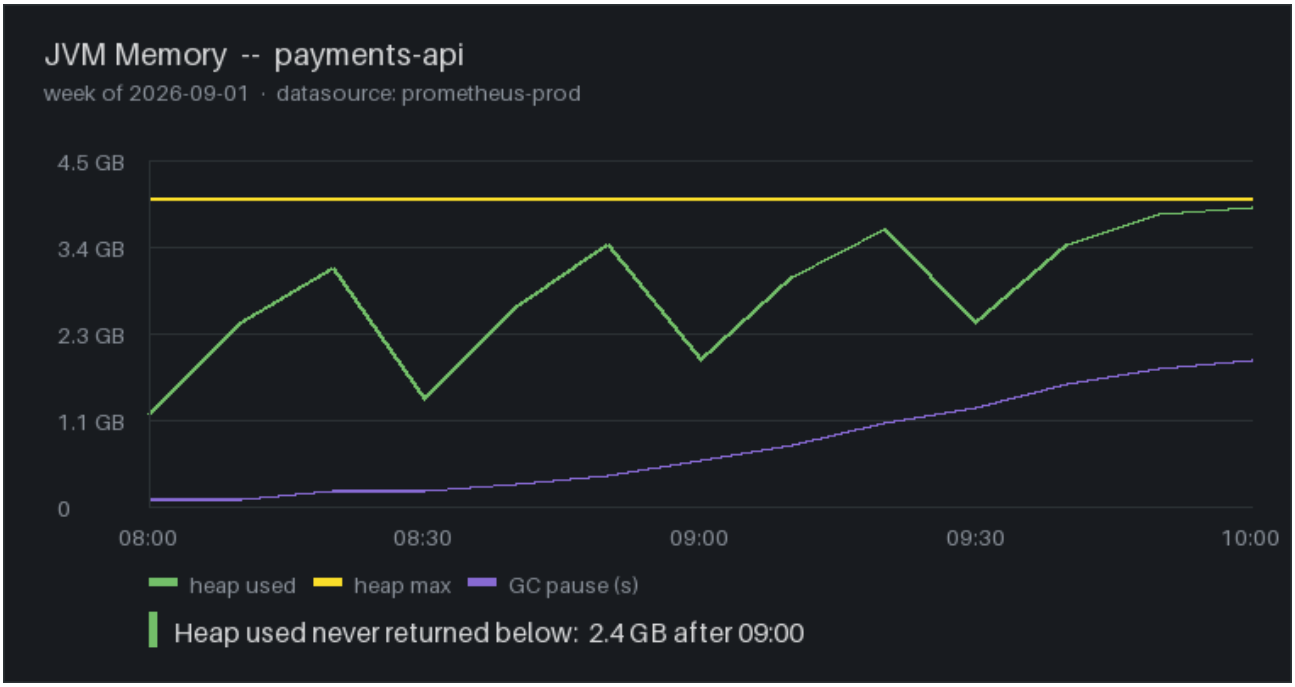

Root cause: the three incidents of the week share one cause -- a retry budget that is configured per service and enforced nowhere, so each component amplified the failure of the one beneath it.

The three panels that follow are the evidence the review was held over. The revenue at risk for the week is on the last of them and in no sentence here.

Checkout latency across the week, by percentile.

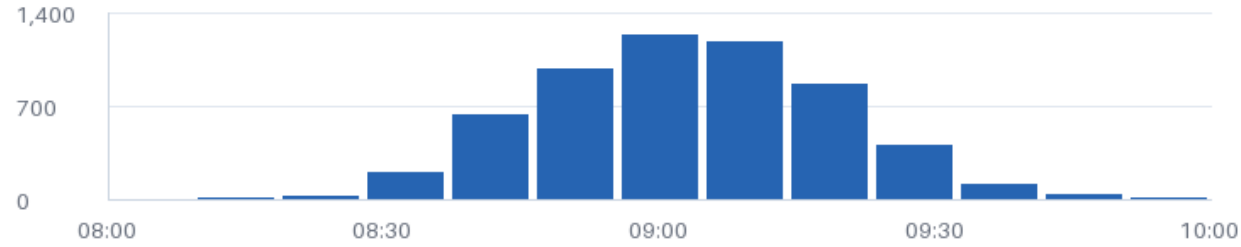

Heap behaviour on payments-api during the same week.

Errors logged across the week, and the cost of them.
