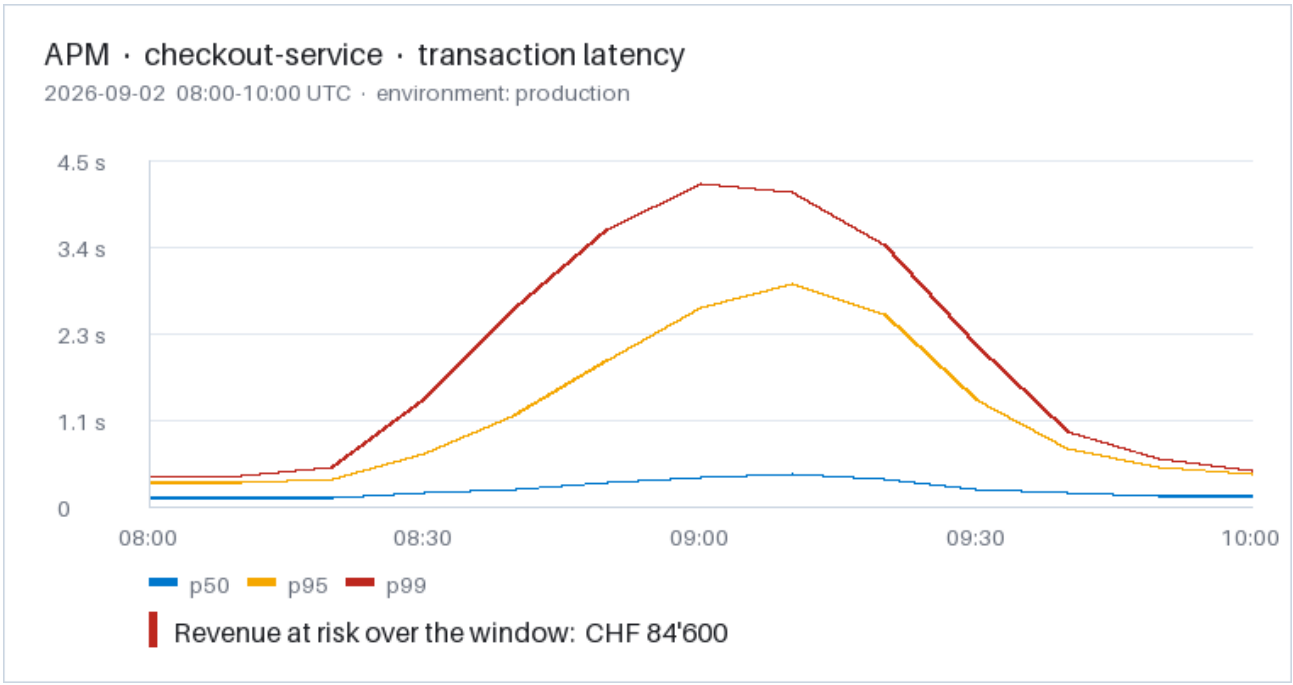
PLAY-3001 -- Checkout latency degradation
Document key: PLAY-3001-checkout-latency-apm.pdf | page 1 of 1

Severity: critical
Resolved: 2026-09-02
Affected systems: checkout-service, payments-gateway

Root cause: the canary released at 08:04 halved the checkout-service connection pool while leaving the retry budget unchanged, so every timed-out request was retried three times against a pool that was already full.


Revenue at risk is shown on the panel below. It is stated in no sentence of this note, deliberately: read it off the chart.
