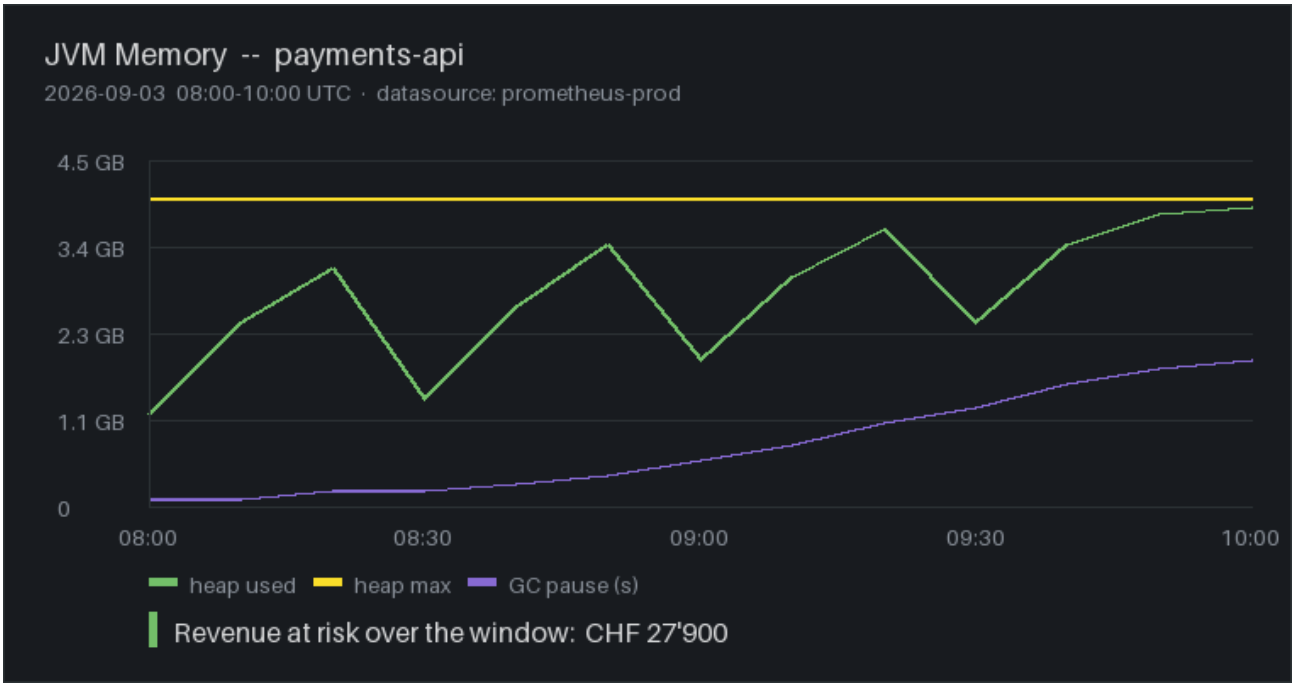
PLAY-3002 -- Payments API heap exhaustion
Document key: PLAY-3002-jvm-heap-grafana.pdf | page 1 of 1

Severity: major
Resolved: 2026-09-03
Affected systems: payments-api

Root cause: entries written to the retry cache during the ledger-batch failover were never evicted, so the old generation grew until every collection reclaimed less than the one before it.


Revenue at risk is shown on the panel below and is written nowhere in this note.
